

Cleaning laser Navigation Unit in Saab 93(2007-2010)

Pict. 1-Press 10 seconds op the eject button above right to open the screen

Pict. 2 – press to release Navi DVD

Pict. 3 Carefully remove the rubber flapper in front of the unit (it has sticky tape)

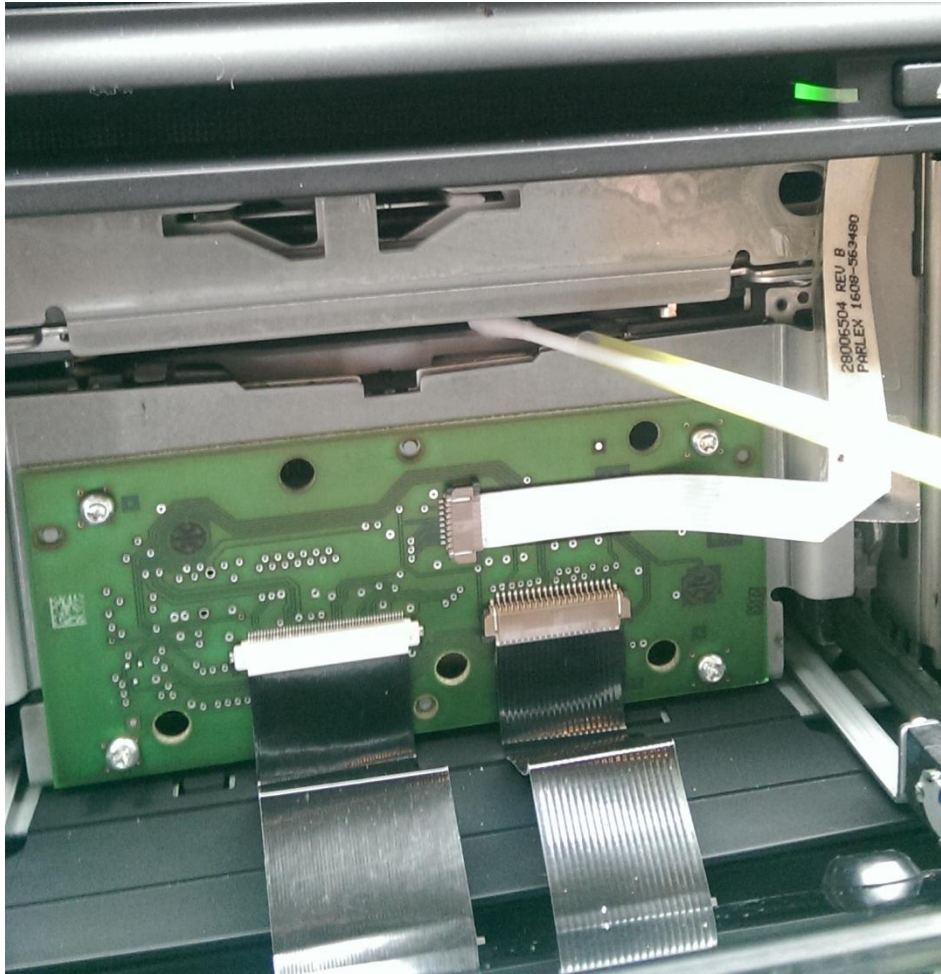

Use a cotton swap with (and/or without) alcohol and an extension, like a straw as shown. (see also example last page) With this extension you can reach the laser which you should be able to see right of the centre . (appr. 2 cm right from the middle of the unit and some 8 cm penetrated inward)

Pict. 4: Find laser and gently clean

- Use a penlight to locate the laser (small glass knob).
- wet the cotton swab with denaturalized alcohol (70%)
- locate the swab above the laser and gently rotate the cotton above the laser
- Then dry the laser with new swab and make sure you do not leave cotton fines behind (a hair may already influence the laser !)

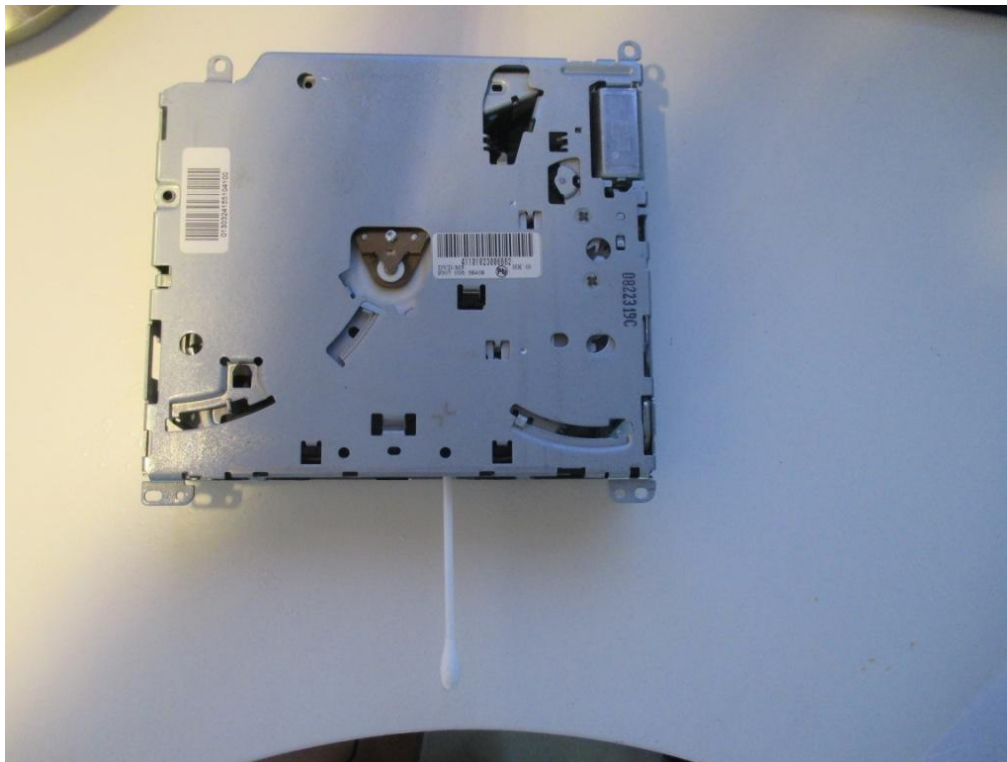

Finally place back the rubber flap in position and insert Navi DVD.

If all goes well your DVD should be read more easily (providing the DVD is the right quality burn !)

Extra info

Below for clarification how and where the cottonswab would be positioned into the unit and how the two cottonswabs can be connected/extended

This is how it looks and where the laser is postioned inside
